**UPS Setup**

**Installing NUT for the OpenUPS**

```
$ sudo aptitude install nut
```

Add the following to `/etc/nut/ups.conf`:

```
[openups]
    driver = usbhid-ups
    port = auto
    desc = "OpenUPS"
```

And comment out the line `maxretry = 3`.

Try if it works:

```
$ sudo upsdrvctl start
```

Then, edit `/etc/nut/nut.conf` such that the last line reads

```
MODE=standalone
```

Finally reboot and run

```
$ sudo upsc openups@localhost
```

This should display information about the connected UPS. Check the `device.model` parameter and make sure that it is OPEN-UPS

**Open UPS Default Settings By Battery**

To load these parameters, you will need to install the Windows tool provided by Mini-Box. When you run it, you should see something like this:
By switching to the settings submenu, you will be able to load the parameters through the **All parameters: File ==> OpenUPS (settings.ini)**. Use the correct settings file from below for your battery.

If you have need to update these files, please send the request to the **IT Channel**
