

Hydrophones

Before reading this page, make sure to check out the **Problem Setup** section of [this page](#).

This page is a summary of how we use the hydrophones to figure out our position.

Note that

The primary results from [this derivation](#) are equations $\ref{eq:xyz}$ and $\ref{eq:p0_initial}$.

$$\begin{aligned} \text{\label{eq:xyz}} x &= \frac{\Delta x (2p_0 - \Delta x) + \delta^2}{2\delta} \\ y &= \frac{\Delta y (2p_0 - \Delta y) + \epsilon^2}{2\epsilon} \\ z &= \frac{\Delta z (2p_0 - \Delta z) + \zeta^2}{2\zeta} \end{aligned}$$

$$0 = p_0^2(a_x + a_y + a_z - 1) + p_0(b_x + b_y + b_z) + (c_x + c_y + c_z)$$

With variable definitions given by $\ref{eq:variable_definitions}$.

$$\begin{aligned} \text{\label{eq:variable_definitions}} a_x &= (\Delta x / \delta)^2 \\ b_x &= (\Delta x / \delta)^2 (\delta^2 + \Delta x^2) \\ c_x &= (\Delta x / \delta)^2 (\Delta x^2 - \delta^2) \\ a_y &= (\Delta y / \epsilon)^2 \\ b_y &= (\Delta y / \epsilon)^2 (\epsilon^2 + \Delta y^2) \\ c_y &= (\Delta y / \epsilon)^2 (\Delta y^2 - \epsilon^2) \\ a_z &= (\Delta z / \zeta)^2 \\ b_z &= (\Delta z / \zeta)^2 (\zeta^2 + \Delta z^2) \\ c_z &= (\Delta z / \zeta)^2 (\Delta z^2 - \zeta^2) \end{aligned}$$

and h_0 is at location $(0,0,0)$
 h_x is at location $(\delta,0,0)$
 h_y is at location $(0,\epsilon,0)$
 h_z is at location $(0,0,\zeta)$

where h_n is a specific hydrophone.

Let us simplify eq. $\ref{eq:p0_initial}$ using the following substitution:
 $a = (a_x + a_y + a_z - 1)$
 $b = (b_x + b_y + b_z)$
 $c = (c_x + c_y + c_z)$

This gives us eq. $\ref{eq:p0_initial_simple}$, which is an ordinary quadratic equation.

$$\begin{aligned} \text{\label{eq:p0_initial_simple}} 0 &= p_0^2 a + p_0 b + c \end{aligned}$$

Applying the quadratic formula to eq. $\ref{eq:p0_initial_simple}$, we can solve for p_0 .

$$\text{\label{eq:p0_solved}} p_0 = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

This will give us two possible solutions for p_0 . We can combine this result with eq. $\ref{eq:xyz}$ to solve for x , y , and z .

Reversing the Problem

Here we describe how the simulator takes the position of the sub and calculates fake hydrophone timing data.

Need figure this part out!
