Using ROS Launch

Normally this is used to start nodes based on a launch file.

Normal Usage:

```bash
roslaunch <PACKAGE> <LAUNCH_FILE>
```

**Listing the Nodes Launched**

This will list the nodes that a launch file will run on stdout.

```bash
roslaunch <PACKAGE> <LAUNCH_FILE> --nodes
```

**Topic Remapping/Argument Replacement**

This allows for changing the topic that a node publishes or subscribes to. This is really useful when using image_view.

```bash
roslaunch <PACKAGE> <LAUNCH_FILE> <ARG>:=<NEW_VALUE> <TOPIC>:=<NEW_TOPIC>
```
